

# ALPINE 6700

Excellent structural integrity and energy efficient uPVC performance.

Enjoy enhanced curb appeal with eye-catching Alpine windows, which offer great durability and resistance to water and air infiltration without sacrificing beauty. Make the most of an attractive combination of energy efficiency, low maintenance, comfort and value with the Alpine uPVC windows—saving you money while keeping your home warm when it's cold outside.

# ALPINE 6700

## Features

- Superior energy performance
- Improved thermal performance, strength and internal drainage
- Low maintenance frame
- Affordable
- Long life span
- Clean, modern look

## Specifications

- Double walled glazing stops
- 6 1/2" & 7 1/2" base frame
- Sealed unit centered within frame
- Dual tandem rollers
- Integrated uPVC drip lip
- Optional tri-pane glazing

## Glossary

### Brickmould

Brickmould is attached to the window or door frame on the exterior of a home. It covers the gap between your home's exterior and the window or door frame.

### Grille

Cross-bars in between the panes of glass to give the impression the window is divided into a number of smaller panes.

### Frame

Our side part of a window consisting of jambs and sills that encloses a window sash.

### Simulated Divided Lites (SDL)

Decorative bars that are placed on the exterior of the glass. This gives the look of divided glass without compromising performance and energy efficiency.

### Mullion

A mullion is the vertical piece that connects side-by-side units of a window.

### Sash

The sash is the part of the window holding the glass in place when the window is being opened. They are available in sliding or hinged models, and create a tight seal with the frame when the window is closed.

### Argon Gas

Argon is an inert gas, non-toxic, clear and odourless. Used to fill the space between panes of glass, it minimizes convective currents reduces the chance of glass collecting frost on cold winter days.

### Dual Clear Glass

Dual Clear Glass is two panes of glass with no special coating applied. The panes are spaced a ½ inch apart and the air between the panes acts as an insulation barrier, making your windows more energy efficient.

### SunStop

SunStop uses two layers of Low-E coating to block out the sun's heat, light and UV rays. Perfect for south and west-facing windows, this coating keeps your home cool in the summer and warmer in the winter with superior insulation performance.

### Triple Pane

Also spaced a ½ inch apart, these three panes provide more insulation than dual pane when it comes to energy efficiency. Enjoy lower heating costs, virtually no condensation and an excellent sound barrier, giving your home added privacy.

### Low-E

Low emissivity is a clear coating that reduces heat loss by reflecting furnace heat back into a room, allowing lots of outside solar energy to pass into your home. In winter, it can even reduce the demands on your furnace. Low-E can offer 35%-105% better insulation when combined with dual/triple pane glass.

### Thermal & Structural Ratings

Energy efficiency for windows is a crucial aspect of modern building design, aiming to minimize energy loss and reduce utility costs while enhancing comfort. In Canada, the North American Fenestration Standard (NAFS) plays a significant role in setting the performance criteria for windows and doors. NAFS provides a comprehensive framework for assessing and certifying the performance of fenestration products, ensuring they meet rigorous standards for energy efficiency, durability, and weather resistance.

### ENERGY STAR® CERTIFIED

ENERGY STAR is a third party assessment of the energy efficiency of products. We proudly manufacture ENERGY STAR certified products including many that qualify for the "Most Efficient" program.
